

BIBFRAME 2.0 Specification

Administrative Metadata

March 29, 2016
Library of Congress

This is one of a set of specifications for BIBFRAME 2.0.

Property **bf:adminMetadata** and class **bf:AdminMetadata**

Property **bf:adminMetadata** and class **bf:AdminMetadata** are used to isolate administrative metadata about the description of a resource. Suppose for example the resource is a book. Administrative metadata about the description of that book might include metadata creationDate (intended to convey the date the description was created, not the creation date of the book).

Example

In this example there is an instance, an ISSN for the Instance, and administrative metadata associated with the ISSN (assigner of the ISSN).

```
<http://bibframe.example.org/instanceX>
  a          bf:Instance ;
  bf:title   [rdfs:label  "Medical history" ] ;
  bf:identifiedBy [
    a          bf:Issn ;
    rdf:value   "2168-7633" ;
    bf:adminMetadata [
      a          bf:AdminMetadata ;
      bf:assigner "United States" ] ] .
```
